Problem statement

Ideation phase

Team I'd	PNT2022TMID20531
Project Name	Emerging Methods for Early Detection
	of Forest Fires

	Humans are responsible for 75% of all
I am	forest fire. Naturally occurring forest
	fires can be caused by
	lightning,volcanic activity and coal
	seam fires, though these are relatively
	rare.
I'm trying to	Using the recent technologies to avoid
	forest fires in Deep learning based on
	pre-trained satellite image processing
	and forest officer can view the
	recommanable forest fires through
	Gmail sms so avoid overexposure.

Problem statement:

The most common hazard in forests is forests fire. They pose a treat not only to the forest wealth but also to the entire regime to fauna and flora seriously disturbing the bio —diversity and the ecology and environment of region. During summer, when there is no rain for months, the forests become littered with dry senescent leaves and twinges, which could burst into flames ignited by the slightest spark. Forest fire causes imbalances in nature and endangers biodiversity by reducing faunal and floral wealth. Traditional methods of fire prevention are not proving effective and it is now essential to raise public awareness on the matter, particularly among those people who live close to or in forested areas.

	I don't know much about the recent
But,	technology that helps me predict forest
	fires, and I haven't found the right
	solutions for forest fires.
	I don't want to cause devasting damage
Because	to both nature and humans, air
	pollution, every fire huge amounts of
	gases released in the atmosphere.
Which makes me feel	I'm not capable of early detect the fires
	and maintaining the area clean of forest
	but I trying solution for this problem.
